## Phase\_1 Project Submission

Please fill out:

Student name: Felix AwinoStudent pace: part time

Scheduled project review date/time: N/A

· Instructor name: Everlyne Asiko

Blog post URL:N/A

## PROBLEM STATEMENT

The project requires that we use exploratory data to review a set of movie data from a selected studio and use the findings as an insight into advising the head of Microsoft new moview studio on what films to create.

# The Project will attempt to answer the Questions below.

Having reviewed the dataset provided, I decided to work with the IM.DB SQL database which contained a good amount of data for consideration. The following key pointers could be retrived from the data through data cleaning and analysis as shall be demonstarted hereafter.

The following key issues will be relevant in advising the M/S movie production director appropriately.

- · Which are the top ten genre of movies in production by volume.
- · Which are the highest rated movies in production.
- Is there any correlation between the production volume and the movie ratings.

## **DATA ANALYSIS PROCESS**

In order to answer the subject question, we shasll use Data Analysis with Pandas in order to work hthrough the provided dataset. We shall go through the below key steps in our data analysis process.

- 1. Data exploration in Pandas
- 2. Data cleaning
- 3. Data analysis in Pandas

## **Data Exploration in Pandas**

This process will involve the below key areas.

- Checking the data and datatypes.
- · Note any cleaning and/or engineering to be done

```
In [1]: #importing necessary libraries for this analysis
    import pandas as pd
    import sqlite3
    import numpy as np
    import matplotlib.pyplot as plt
```

## **Loading the Data**

Since we intend to use the SQL database we shall upload the databse file into this work book and connect to the SQL databse as demonstrated below.

We will then explore the tables in the SQL dataframe before deciding on which information will bne relevant for ouir intended analysis.

This will be demostrated in the next few code cells.

```
In [2]: #connecting to the IM.DB SQL database
         conn = sqlite3.connect('/content/im.db')
In [3]: #Reading the table name component of the SQL database.
         df = pd.read sql("""SELECT name FROM sqlite master WHERE type = 'table';""", c
         df
Out[3]:
                   name
            movie_basics
          0
          1
                directors
          2
               known for
          3
              movie_akas
            movie_ratings
          5
                 persons
          6
                principals
          7
                  writers
```

## **Data processing and Cleaning**

In order to proceed with the analysis we will take the data thrpugh various data cleaning processes that will ensure the final dasta is accurate and verifiable for our use. This will ensure that our analysis has limited assumptions and is most accurate.

```
In [13]: #checks for the overview of the data.
         im_movies_df.info()
         <class 'pandas.core.frame.DataFrame'>
         RangeIndex: 73856 entries, 0 to 73855
         Data columns (total 9 columns):

## Data Cleaning.

Having had an overview of the data layout, we will proceed to some cleanig. Our focus will be majorly on the column 'genres' as it will be the basis of our analysis going forward.

```
In [15]: #check count of missing values
         im_movies_df.isna().sum()
Out[15]: movie_id
                                0
         primary title
                                0
         original title
                                0
         start year
                                0
         runtime_minutes
                             7620
                              804
         genres
                                0
         movie_id.1
         averagerating
                                0
         numvotes
         dtype: int64
In [16]: #check percentage of missing items on eaxch column.
         percent_missing = im_movies_df.isna().sum() / len(im_movies_df) * 100
         print(percent missing)
         movie_id
                              0.000000
         primary_title
                              0.000000
         original_title
                              0.000000
                              0.000000

                              0.000000
         dtype: float64
```

## Action on missing data.

From the above summary of missing values on each column, looking at our column of interest, we can see that there is a 1% data missing in the genres data. We shall opt to drop the rows with missing data because this is a small portion of data and it will not change our outcomes by a large margin.

```
In [17]: #drop rows where genre is missing.
im_movies_df = im_movies_df.dropna(subset=['genres'])
```

In [18]: #display new im\_movies\_df after dropping some rows from the datfame on the gen im\_movies\_df

## **Data Cleaning.**

Having had an overview of the data layout, we will proceed to some cleanig. we reaslise the production budget, the domestic gross and the world wide gross amounts are in dollars and have the dollar sign added. We are thus unable to do any statistical analysis on the data. We are thus bound to do a further cleanin gon the data to make it workable. The next few codes willbe used to carry out data cleaning.

```
In [31]: #stripping the data of the dollar sugn character.
           def remove character(data, cols, characters):
               """simple function to remove characters"""

#### **SUMMARY AND CONCLUSIONS**

From the analysis we were able to pick out the following fsacts around the movies in the given dataset.

- The three top genres in production are drama, documentary and comedy. In the event that
  the movie house intends to reach to the largest audience, these three genres would be a
  good place to get started.
- On the highest rsted movies, the clear outcome from that analysis will be deebunked in the
  next conclusion that the highest rating movies are not necessaily the ones that rack in the
  most profits or the highest viewership.
- · We were also able to pick out the highest grossing movies. The top three being
- 1. Adventure, drama, sport
- 2. Fantasy, romance
- 3. Family, fantasy, musical

These would be the top three recommendations to the production house were we to realise the highest profit margins.
